RE: Flow Calc 2009 Testimonial

I find the software simple to use and providing results instantaneously for a variety of hydraulic applications in Civil Engineering that far surpasses any other commercial application available.

It has been flawless in the modeling of various open channel and roadway cross sections providing critical design information to facilitate projects' flood control analysis and design decisions.

I would recommend to anyone who uses this type of software in their day-to-day civil engineering hydraulic software that solves the problems encountered in the design of residential, commercial and industrial developments.

There are other choices in civil engineering hydraulics computer software, but this software is the best bang for the buck.

An impressive computer software program designed for a variety of hydraulic applications in Civil Engineering!

Sincerely,

Jon Hayslip, P.E., CFM
President
